8Mx72 DRAM DIMM with ECC Using 8Mx8, 4K & 8K Refresh, 5V

GENERAL DESCRIPTION

The Samsung KMM372C80(8)3C is a 8Mx72bits Dynamic RAM high density memory module. The Samsung KMM372C80(8)3C consists of nine CMOS 8Mx8bits DRAMs in SOJ/TSOP-II 400mil packages and two 16 bits driver IC in TSSOP package mounted on a 168-pin glass-epoxy substrate. A 0.1 or 0.22uF decoupling capacitor is mounted on the printed circuit board for each DRAM. The KMM372C80(8)3C is a Dual In-line Memory Module and is intended for mounting into 168 pin edge connector sockets.

PERFORMANCE RANGE

- Fast Page Mode Operation
- CAS-before-RAS Refresh capability
- RAS-only and Hidden refresh capability
- TTL compatible inputs and outputs
- Single 5V±10% power supply
- JEDEC standard pinout & Buffered PDpin
- Buffered input except RAS and DQ
- PCB : Height(1250mil), single sided component

NOTE : A12 is used for only KMM372C883CK/CS (8K Ref.)

PD Note : PD & ID Terminals must each be pulled up through a resistor to Vcc at the next higher level assembly. PDs will be either open (NC) or driven to Vss via on-board buffer circuits.
ID Note : IDs will be either open (NC) or connected directly to Vss without a buffer.

PIN NAMES

Pin Names	Function
A0, B0, A1 - A11	Address Input(4K ref.)
A0, B0, A1 - A12	Address Input(8K ref.)
DQ0 - DQ71	Data In/Out
W0, W2	Read/Write Enable
OE0, OE2	Output Enable
RAS0, RAS2	Row Address Strobe
CAS0, CAS4	Column Address Strobe
Vcc	Power(+5V)
Vss	Ground
NC	No Connection
PDE	Presence Detect Enable
PD1 - 8	Presence Detect
ID0 - 1	ID bit
RSVD	Reserved Use
RFU	Reserved for Future Use

Pins marked '*' are not used in this module.

NOTES

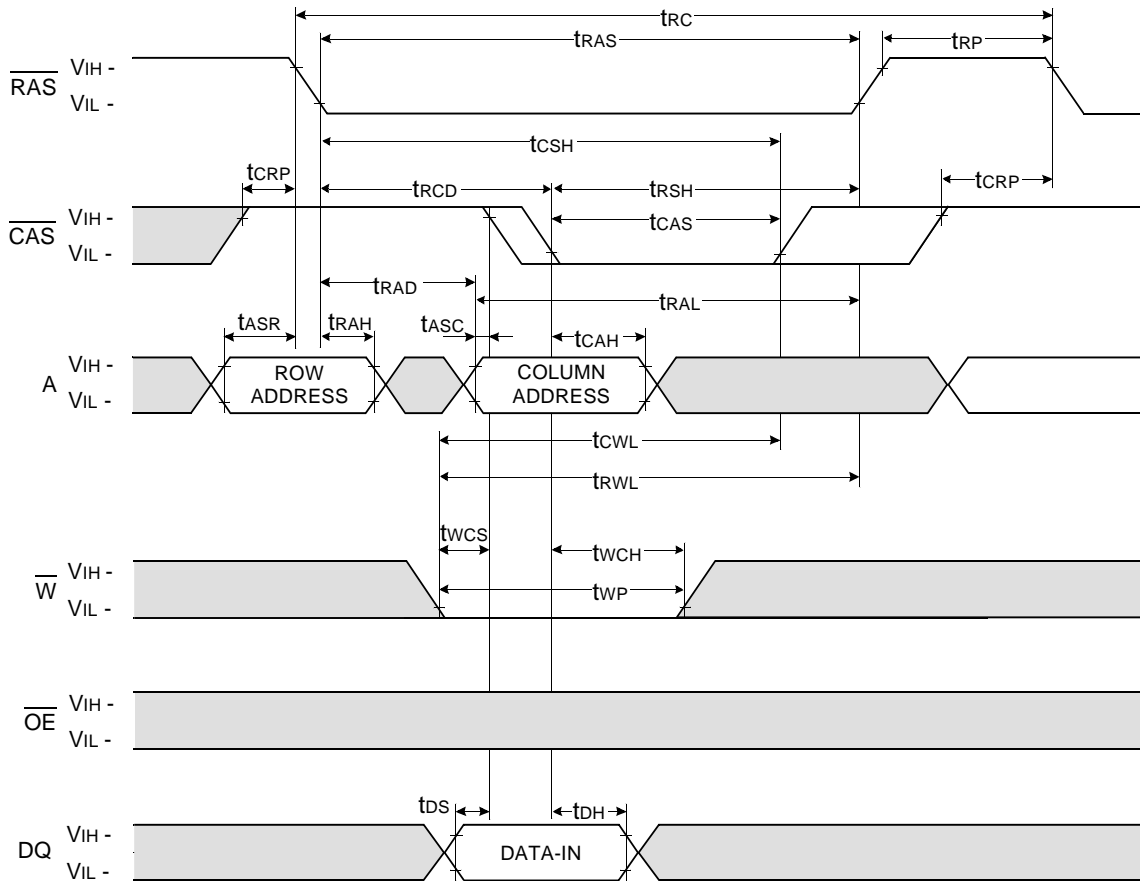

1. An initial pause of 200us is required after power-up followed by any 8 RAS-only or CAS-before-RAS refresh cycles before proper device operation is achieved.
2. Input voltage levels are V_{IH}/V_{IL} . $V_{IH}(\min)$ and $V_{IL}(\max)$ are reference levels for measuring timing of input signals. Transition times are measured between $V_{IH}(\min)$ and $V_{IL}(\max)$ and are assumed to be 5ns for all inputs.
3. Measured with a load equivalent to 2 TTL loads and 100pF.
4. Operation within the $trCD(\max)$ limit insures that $trAC(\max)$ can be met. $trCD(\max)$ is specified as a reference point only. If $trCD$ is greater than the specified $trCD(\max)$ limit, then access time is controlled exclusively by $tcAC$.
5. Assumes that $trCD \geq trCD(\max)$.
6. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} .
7. $twCS$, $trWD$, $tcWD$, $tAWD$ and $tcPWD$ are not restrictive operating parameter. They are included in the data sheet as electrical characteristics only. If $twCS \geq twCS(\min)$ the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle. If $trWD \geq trWD(\min)$, $tcWD \geq tcWD(\min)$, $tAWD \geq tAWD(\min)$ and $tcPWD \geq tcPWD(\min)$. The cycle is a read-modify-write cycle and the data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of data out(at access time) is indeterminate.
8. Either $trCH$ or $trRH$ must be satisfied for a read cycle.
9. These parameters are referenced to the CAS leading edge in early write cycles.
10. Operation within the $trAD(\max)$ limit insures that $trAC(\max)$ can be met. $trAD(\max)$ is specified as reference point only. If $trAD$ is greater than the specified $trAD(\max)$ limit, then access time is controlled by tAA .
11. The timing skew from the DRAM to the DIMM resulted from the addition of buffers.

The diagram illustrates the timing relationships for a memory device. The signals and their timing parameters are as follows:

- RAS**: $\overline{\text{RAS}}$ signal. Timing parameters: t_{RAS} (high pulse width), t_{RC} (period from falling edge to next falling edge), t_{RP} (high pulse width after precharge), t_{CRP} (high pulse width after precharge).
- CAS**: $\overline{\text{CAS}}$ signal. Timing parameters: t_{CD} (delay from RAS falling edge to CAS falling edge), t_{RSH} (high pulse width), t_{CAS} (high pulse width), t_{CRP} (high pulse width after precharge).
- A**: Address signal. Timing parameters: t_{ASR} (setup time before RAS), t_{RAH} (hold time after RAS), t_{ASC} (setup time before CAS), t_{CAH} (hold time after CAS).
- W**: $\overline{\text{W}}$ signal. Timing parameters: t_{RCS} (delay from RAS falling edge to $\overline{\text{W}}$ falling edge), t_{RRH} (high pulse width), t_{rCH} (high pulse width after precharge).
- OE**: $\overline{\text{OE}}$ signal. Timing parameters: t_{AA} (delay from RAS falling edge to $\overline{\text{OE}}$ falling edge), t_{OEA} (high pulse width), t_{OEZ} (high pulse width after precharge).
- DQ**: Data bus signal. Timing parameters: t_{AC} (access time), t_{CLZ} (delay from RAS falling edge to data output), t_{CAC} (delay from CAS falling edge to data output), t_{CLZ} (delay from CAS falling edge to data output), t_{AC} (access time), t_{CLZ} (delay from RAS falling edge to data output).
