
mm inch

## FEATURES

- Sealed construction for automatic wave soldering and cleaning
- Latching types available
- High sensitivity - TTL direct drive possible
- High speed - Up to 500 cycle/sec. operations
- Wide switching range and high welding resistance Gold cobalt (AuCo) contact permits
- Wider switching range from low level up to high current: $10 \mu \mathrm{~A}$ to 1 A
- Higher sticking resistance to inrush current
- Stable contact resistance from initial stage throughout life

## SPECIFICATIONS

Contact

| Arrangement |  |  | 1 Form C |
| :---: | :---: | :---: | :---: |
| Initial contact resistance, max. (By voltage drop 6 V DC 1 A) |  |  | $60 \mathrm{~m} \Omega$ |
| Initial contact pressure |  |  | Approx. 5 g .18 oz |
| Contact material |  |  | Gold cobalt |
| Electrostatic capacitance | ContactContact | Sealed type | 3 pF |
|  |  | Magnetically sealed type | 4 pF |
|  | N.O. contact-coil | Sealed type | 4 pF |
|  |  | Magnetically sealed type | 5 pF |
|  | N.C. contact-coil | Sealed type | 5 pF |
|  |  | Magnetically sealed type | 6 pF |
|  | Nominal switching capacity |  | $\begin{gathered} \text { 1A } 20 \text { VDC, } \\ 0.3 \mathrm{~A} 110 \text { VAC } \end{gathered}$ |
| Rating (resistive) | Max. switching power |  | $33 \mathrm{VA}, 20 \mathrm{~W}$ |
|  | Max. switching voltage |  | $110 \mathrm{~V} \mathrm{AC}$,30 V DC |
|  | Max. switching current |  | AC 0.3 A, DC 1 A |
|  | Min. switching power |  | Approx. $100 \mathrm{mV} 10 \mu \mathrm{~A}$ |
| Expected life (min. operations) | Mechanical (at 500 cps .) |  | $10^{9}$ |
|  | Electrical (resistive) | $\begin{aligned} & \hline 1 \mathrm{~A} 20 \mathrm{~V} \text { DC/ } \\ & 0.3 \mathrm{~A} 110 \mathrm{~V} \mathrm{AC} \end{aligned}$ | $10^{6}$ (at 1 cps .) |
|  |  | $\begin{array}{\|l\|} \hline 0.5 \text { A } 30 \text { V DC/ } \\ 0.1 \text { A } 110 \text { V AC } \\ \hline \end{array}$ | $3 \times 10^{6}$ (at 2 cps .) |
|  |  | 0.25 A 30 V DC/ <br> 0.25 A 30 V AC | $5 \times 10^{6}$ (at 5 cps .) |
|  |  | 0.2 A 24 V DC/ <br> 0.2 A 24 V AC | $10^{7}$ (at 25 cps.$\left.\right)$ |
|  |  | $\begin{aligned} & \hline 0.1 \text { A } 12 \mathrm{~V} \text { DC/ } \\ & 0.1 \text { A } 12 \mathrm{~V} \text { AC } \end{aligned}$ | $5 \times 10^{7}$ (at 50 cps .) |
|  |  | $\begin{array}{\|l\|} \hline 0.1 \text { A } 9 \text { V DC/ } \\ 0.1 \text { A } 9 \text { V AC } \end{array}$ | $10^{8}$ (at 100 cps .) |

Coil (polarized) (at $25^{\circ} \mathrm{C} 77^{\circ} \mathrm{F}$ )

| Minimum operting power | Single side stable | 72 to 133 mW |
| :--- | :--- | :---: |
|  | 1 coil latching | 41 to 45 mW |
|  | 2 coil latching | 72 to 107 mW |

## Remarks

* Specifications will vary with foreign standards certification ratings.
*1 Measurement at same location as "Initial breakdown voltage" section
*2 Min. $500 \mathrm{M} \Omega$ at 100 V DC between coils of 2 coil latching type
*3 Detection current: 10 mA , Except for between coils of 2 coil latching type
*4 Excluding contact bounce time
*5 Half-wave pulse of sine wave: 6 ms ; detection time: $10 \mu \mathrm{~s}$
*6 Half-wave pulse of sine wave: 6 ms
*7 Detection time: $10 \mu \mathrm{~s}$
*8 Although NR relays are rated at $10 \mathrm{G} / 55 \mathrm{cps}$. vibration resistance, they will withstand up to $60 \mathrm{G} / 2,000 \mathrm{cps}$., provided they receive additional support such as anchoring to the PC board with epoxy resin.
*9 Refer to 5. Conditions for operation, transport and storage mentioned in AMBIENT ENVIRONMENT (Page 61)
*10 Total temperature (ambient temperature plus temperature rise in coil) should not exceed $90^{\circ} \mathrm{C} 194^{\circ} \mathrm{F}$ for single side stable, and $105^{\circ} \mathrm{C} 221^{\circ} \mathrm{F}$ for latching relays. See Reference Data for determination of coil voltage versus temperature.

## TYPICAL APPLICATIONS

Telecommunications equipment, alarm devices, machine tools, NC machines, automatic warehouse control, conveyors, air-conditioners, pressing machines, tex-
tile machinery, elevators, control panels, pin-board programmers, parking meters, industrial robots, detectors, annunciators, optical instruments, business machines,
time recorders, cash registers, copiers, vending machines, medical equipment.

## ORDERING INFORMATION

(Notes) 1. Power types and 1 Form A types are available on request.
2. For UL/CSA recognized types, delete " $N$ " at head portion of part No. and add suffix UL/CSA, when ordering. Ex. RSD-12V UL/CSA
3. Standard packing Carton: 50 pcs., Case: 500 pcs.

## DIMENSIONS

General tolerance: $\pm 0.5 \pm .020$

Terminal dimensions (Except soldering)

| Terminal No. | Thickness | Width |
| :---: | :---: | :---: |
| 1,7 | 0.5 | 0.6 |
|  | .020 | .024 |
| 4 | 0.3 | 0.7 |
|  | .012 | .028 |
| 2, 3, 5, 6, | 0.5 DIA. |  |
| ground terminal | .020 DIA. |  |
| Soldering: 0.3 .012 max. |  |  |

DIFFERENCES BETWEEN NR RELAYS AND REED RELAYS

| , | NR relays | Reed relays |
| :---: | :---: | :---: |
| Structure |  |  |
| Contact arrangement | 1 Form C | 1 Form A or 1 Form B |
| Contact capacity | 20 W (high contact pressure) | 5 to 15 W |
| Operating function | Single side stable Latching | Single side stable |
| "Getter" hole | Yes | No |

"Getter" holes are formed on both pole shoes to obtain uniform contact resistance throughout life. Film-forming phenomena on contacts is thus fully prevented.

## REFERENCE DATA

1.-(1) Contact reliability

Test sample: NR-SD-24V 54 pcs.
Circuits: (A) Following figure with diode
(B) Following figure without diode

Item to be checked: Detect with the circuit stopped Circuits:
(A) Diode provided: The circuit does not stop throughout 100 million times.
(B) Diode not provided: $\lambda_{60}=2.5 \times 10^{-8}$ times
3.-(1) Operate time including bounce time (Single side stable)

1.-(2) Contact reliability

TEST CONDITION
Sample: NR-SD-24V, 10 pcs.
Contact voltage: 100 mV
Contact current: $10 \mu \mathrm{~A}$
Cycle rate: 50 cps .
Detection level: $100 \Omega$
Testing operation: $3 \times 10^{7}$
$\mathrm{m}=1.9$
$\sigma=2.5 \times 10^{7}$
$\mu=4.7 \times 10^{7}$
$95 \%$ reliability limit: $1.15 \times 10^{7}$
(Mean time between failure)

2. Coil temperature rise (under saturated condition)

4. Release time including bounce time (Single side stable)

5.-(1) Leaving at high temperature
(Change of pick-up and drop-out voltages) Tested sample: NR-SD-24V, 30 pcs. Condition: Deenergized leaving at $90^{\circ} \mathrm{C} 194^{\circ} \mathrm{F}$ (constant temperature)

7. Contact sticking resistance

TEST CONDITION
The purpose of this test was to confirm contact sticking resistance and contact stability against coil ripples.
Tested Sample: NR-SD-24V, 10 pcs.
Test method: Following coil ripples were applied.
Test period: 500 hours

9.-(1) Rate of change in pick-up and drop-out voltage (Single side stable)

10.-(2) Mechanical life
(Change of contact resistance)
Tested Sample: NR-SD-24V, 10 pcs.
Operation frequency: 500 cps

$\rightarrow$ No. of operations, $\times 10^{4}$
5.-(2) Leaving at high temperature (Change of contact resistance)
Tested sample: NR-SD-24V, 30 pcs.
Condition: Deenergized leaving at $90^{\circ} \mathrm{C} 194^{\circ} \mathrm{F}$ (constant temperature)

TEST RESULT
No occurance of sticking was observed.
Contact resistance: Fig. 1
NR-SD-24V: $29 \mathrm{~m} \Omega$ to $30.4 \mathrm{~m} \Omega$

In actual application, above coil ripples should be avoided and use of a capacitor in the circuit is recommended to keep the ripple factor below 5\%.
9.-(2) Rate of change in pick-up voltage (2 coil latching)

11.-(1) Electrical life
(1 A 20 V DC resistive load)
Tested sample: NR-SD-24V, 10 pcs.

$\longrightarrow$ No. of operations, $\times 10^{4}$
6. High frequency characteristics

Tested sample: NR-SD-24V
Tested condition:

8. Distribution of contact resistance Tested sample: NR-SD-24V (WG type) 105 pcs.

10.-(1) Mechanical life
(Change of pick-up and drop-out V )
Tested Sample: NR-SD-24V, 10 pcs.
Operation frequency: 500 cps

11.-(2) Electrical life

Tested Sample: NR-SD-24V, 10 pcs.
Load: 60 mA 24 V DC resistive load
Frequency: 50 cps

$\longrightarrow$ No. of operations, $\times 10^{4}$
11.-(3) Electrical life

Tested Sample: NR-SD-12V, 10 pcs. Load: 54 mA 12 V DC inductive load with diode protection
(4 relay coils in parallel of NR-SD-12V)
Frequency: 50 cps

$\longrightarrow$ No. of operations, $\times 10^{4}$
11.-(4)Electrical life
(327 mA 24 V DC relay coil load)
Tested sample: NR-SD-24V, 5 pcs.
Condition: HP2-DC24×6 pcs. in parallel, diode protector provided

## 13. High temperature test

TEST CONDITION
Tested Sample: NR-SD-24V, 30 pcs.
Ambient temperature: $80^{\circ} \mathrm{C} 176^{\circ} \mathrm{F}$
Humidity: less than $50 \%$ R.H.
Exposure time: 2,000 hours with relays deenergized.
TEST RESULT
Contact resistance: Fig. 1
All samples were measured less than
$100 \mathrm{~m} \Omega$ in contact resistance throughout this test.

| Distance <br> Type | $\begin{gathered} 0 \\ (0) \end{gathered}$ | $\begin{gathered} 5 \\ (.197) \end{gathered}$ | $\begin{gathered} 10 \\ (.394) \end{gathered}$ | $\begin{gathered} 15 \\ (.591) \end{gathered}$ |

| Magnetically shielded type | $\pm 5 \%$ | $\pm 1 \%$ | 0 | 0 |
| Sealed type | - | $\pm 10 \%$ | $\pm 6 \%$ | $\pm 2 \%$ |

15. Resistive load test

TEST CONDITION
Tested Sample: NR-SD-24V, 10 pcs.
Load: 1 A 20 V DC Resistive
Cycle rate: 1.4 cps .
Contact resistance in life test

## APPLICATION HINTS

## Contact protection circuit

When using NR relays in inductive load circuits, a contact protection circuit is recommended.

## Examples:

| CR | CR | Diode |
| :---: | :---: | :---: |
| (L) : Inductive load |  |  |
| 1. $\mathrm{r}=$ more than 20 to 30 ohms <br> 2. In an $A C$ circuit impedance of $L$ is to be somewhat smaller than impedance of $r$ and c . | Can be used for both AC and DC circuits. Use 500 to 1000 ohms for $r$ and $0.1 \mu \mathrm{~F}$ to $0.2 \mu \mathrm{~F} 200 \mathrm{~V}$ for c in a general 12 to 24 V load circuit. | For DC circuits only. |

The following is life data under our HP2 relay load.

| Contact voltage | Contact current | Contact protection circuit | Operating speed | Expected life, min. op. |
| :---: | :---: | :---: | :---: | :---: |
| 6 V DC | 232 mA | $0.2 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ or diode | $2 \mathrm{op} . / \mathrm{s}$ | $3 \times 10^{7}$ |
| 12 V DC | 106 mA | $0.2 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ or diode | $2 \mathrm{op} . / \mathrm{s}$ | $3 \times 10^{7}$ |
| 24 V DC | 54 mA | $0.1 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ or diode | $2 \mathrm{op} . / \mathrm{s}$ | $3 \times 10^{7}$ |
| 100 V DC | 15 mA | $0.1 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ or diode | $2 \mathrm{op} . / \mathrm{s}$ | $2 \times 10^{7}$ |
| 24 V DC | 80 mA | $0.2 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ | $2 \mathrm{op} . / \mathrm{s}$ | $3 \times 10^{7}$ |
| 100 V DC | 20 mA | $0.1 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ or varistor | $2 \mathrm{op} . / \mathrm{s}$ | $2 \times 10^{7}$ |
| 200 V DC | 10 mA | $0.1 \mu \mathrm{~F}+1 \mathrm{k} \Omega$ | $2 \mathrm{op} . / \mathrm{s}$ | $2 \times 10^{7}$ |

(Notes)

1. When inrush current occurs in the capacitor load circuit or incandescent lamp load circuit, reduce it to less than 5 A . Electrical life of "AuCo" contact types is 10,000 operations in a 5 A inrush current circuit.
2. When 5 A to 10 A inrush current occurs in the capacitor load circuit or incandescent lamp load circuit, the use of power types is recommended.

## 2 coil latching types

A) The circuit at right is recommended when using one coil for latching and the other coil for reset.
NR relays are sensitive enough to be operated by the discharge of energy accumulated in the inner-coil capacitance. The use of a diode of over 200 V breakdown will prevent misoperation from this source. In order to maintain the insulation between the two coils, connection of the terminal No. 3 and No. 6 or the terminal No. 2 and No. 5 is recommended, as shown in the right figure.

Rectifiers should be inserted in this circuit when the nominal coil voltage of the NR relay is more than 24 V DC.
B) No damage will occur to the coil of either the one or two coil latching types even if the operating voltage is as much as 2 or 3 times the nominal coil voltage.
C) If separate pulses are applied to each coil of the 2 coil latching types, the first pulse will operate when the pulses are of equal voltage. When voltages differ the higher voltage will cause operation provided the voltage difference is greater
than the measured pick-up voltage. Voltage difference on the coils will reduce contact pressure proportionately.
Continuous bias voltage after an operating pulse lowers contact pressure and vibration resistance.

Ripple factor

Coils should be operated on pure DC.
Rectified AC may cause changes in the
pick-up/drop-out characteristics because of the ripple factor. Use of a capacitor in
the circuit is recommended to keep the ripple factor below $5 \%$.

To calculate the ripple factor
Ripple factor $(\%)=\frac{E \text { max. }-E \text { min. }}{E \text { mean }} \times 100 \%$
E max. = max. value of pulsating component
E min. $=$ min. value of pulsating component E mean - average value DC component

## When designing NR relay circuits

Care should be taken when designing relay circuits since the response of the relay is so fast that bouncing or chattering from conventional relays in the circuit may cause false operation.

## When using long lead wires

When long wires (as long as 100 m or more) are to be used, the use of resistance ( 10 to $50 \Omega$ ) in series with the contact is required in order to eliminate the effect of the possible inrush current due to the stray capacitance existing between the two wires or between the wire and ground.

## AC operation of latching relays

When using circuits such as those at the right, avoid continued or extended latching or resetting power input.

## Capacitor discharge operation of latching types

When operating latching types by discharge of a capacitor, more reliable operation can be expected if the time to reach pick-up voltage is greater than 2 ms at 5 to $10 \mu \mathrm{~F}$ : ( 24 V type).

## Automatic coil circuit interruption

Misoperation may occur in self-operated cutoff circuits such as shown at right. This can be avoided by adding a resistor and capacitor and increasing the pick-up voltage to above that specified.
In a timer circuit, step-pulse voltage from PUT (Programmable Unijunction Transistor) or SBS (Silicon Bilateral Switch) is recommended.

## Residual voltage

When single side stable types or latching types are driven by transistor or UJT, residual voltage is sometimes applied to the
coils and decreases contact pressure at N.O. side even if the transistor or UJT are in OFF condition. As a result, characteris-
tics of relays may be harmed. Design your circuits in principle to make such residual voltage zero.

## Short circuit prevention between N.C. and N.O.

The separation of loads or insertion of a resistor for circuit protection are recommended for the circuits where large current flows due to arcing. (See Fig. 1).

Fig. 1

## ACCESSORIES

PC board pattern (Copper-side view)

Tolerance: $\pm 0.2 \pm .008$
