Description

The TDU Series is an encapsulated solid state delay-on-make timer that combines digital timing circuitry with universal voltage operation. DIP switch adjustment allows accurate selection of the time delay over the full time delay range. The TDU Series is an excellent choice for process control systems and OEM equipment.

Operation

Upon application of input voltage, the time delay begins. The output is de-energized before and during the time delay. At the end of the time delay, the output is energized and remains energized until input voltage is removed.

Reset: Removing input voltage resets the time delay and output.

■ Approvals:   

Load may be connected to terminal 3 or 1.
